

##CRISCb- IT Risk Assessment Practices

###Objectives:

At the end of this episode, I will be able to understand:

1. for quantitative risk analysis methodologies:
 - Uses mathematical models to simulate potential outcomes
 - Often referenced by financial or time values
 - Relies on quality data to make accurate predictions
 - Suitable for cost-benefit analysis
 - Uses EMV (Expected Monetary Value) and ALE (Annual Loss Expectancy)
2. for qualitative risk analysis methodologies:
 - Considers the "quality" of the risk.
 - Uses P/I matrix based on subjective H-M-L values on probability and impact
 - Relies heavily on experience of experts
 - Typically based on scenarios or descriptions of possible risk events
3. Causes of risk are not always obvious
 - Root Cause Analysis asks a series of questions to get to the root of the issue
 - Uses a "Fishbone"/Ishikawa diagram
 - Helps with risk assessment to understand the cause and effect
